

Experimenting on Animals Is a Dead End

NIH's future starts with a visionary leader.

Nearly half of NIH's \$41 billion taxpayer-funded budget is squandered on archaic experiments on animals, even though more than 90% of basic research—most of it involving animals—fails to lead to treatments for humans.

NIH must embrace modern, human-relevant research, which is detailed in PETA's Research Modernization Deal.

As reported by *STAT*, the Biden administration's search for a new NIH director is "a once-in-a-generation chance to tackle the agency's shortcomings and turn the government's science strategy upside down."

President Biden, choose a new NIH director who will bring the agency into the 21st century.

"Right now, NIH is a window into the past. It needs to be a window into the future."

—Greg Simon, former executive director, the Cancer Moonshot
